## Tabular Report Generation

# A. Generating Tabular Reports

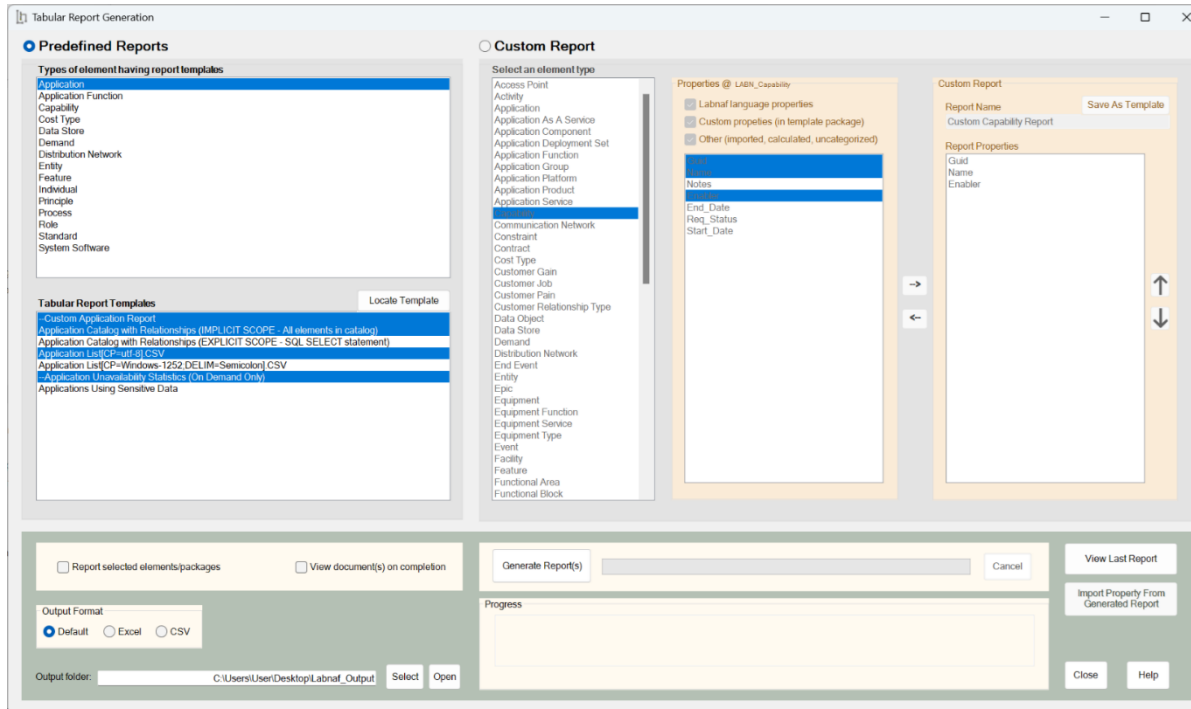

## B. Creating Tabular Report Templates

1. Scenarios for Starting a New Tabular Report Template
  - a. Custom Report
  - b. Clone & Edit
  - c. Model the Structure
2. Collection of Elements to be Reported (scope)
3. Reported Element Properties
4. Reported Connections
5. Report Format
6. Summary

# Reports generation can be performed... either **On Demand** or **Scheduled Periodically**

You can use predefined templates, or create custom reports that you can save as templates

Labnaf PowerShell Command: **GenerateTabularReports**

**Usage** : LNPS GenerateTabularReports [arguments]

**Arguments**:

- **SourceRepoPathName**
- **OutputDirectoryPath**
- **[ElementPrototype]**
- **[TabularReportTemplateName]**

To generate a CSV, add a '.CSV' extension to the tabular report template name.

The name of the CSV file can also define the CSV character encoding and column delimiter. For further information, see ['Inbound/Outbound Content Formatting'](#) on the Guidance Web Site

## Scheduling

You can use either the built-in Labnaf scheduler, or the Windows task scheduler, or your own scheduler.

If you want a report to be ignored by the Labnaf PowerShell, then add the prefix "--" to its template name. The report can then be generated only on demand/ using the user interface.

- ▶  **--Application Unavailability Statistics (On Demand Only)**
- ▶  **Applications Using Sensitive Data**

# Using Predefined Report Templates

## Select the Templates

- Select an element type that has defined report templates
- Select tabular report templates

## Select the Output Location and Format

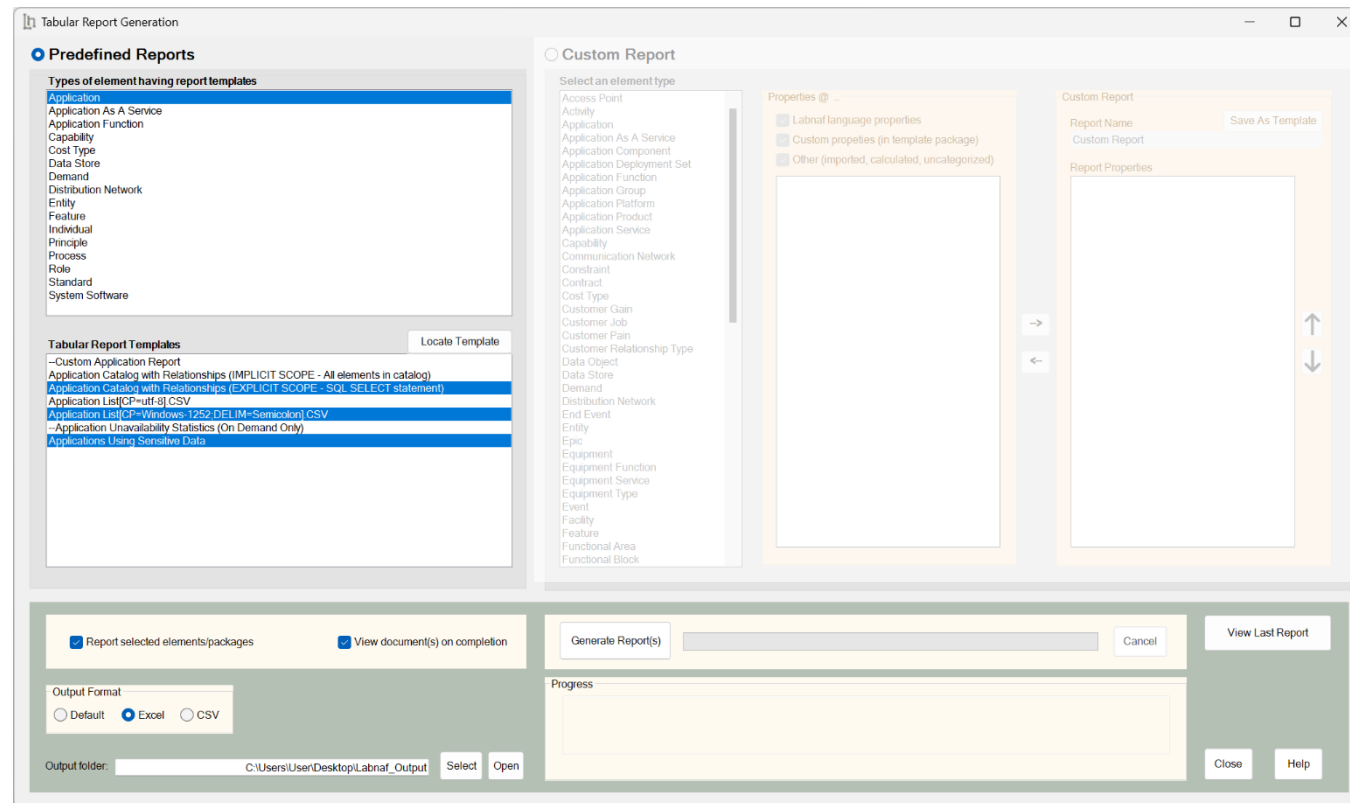

- Select an output folder (typically only once).
- Select an output format (Excel or CSV) i.e. not necessarily using the format defined by the templates.

## Define the Scope

Options for defining a selection of elements (scope) to be reported

- Elements or packages selected in the project browser or in the active diagram
- Elements and packages present in a “scope” diagram that belongs to the template
- Elements selected by a SQL select defined in the template note
- All elements in the catalog (default)

*If multiple scopes have been defined, then the above sequence corresponds to priorities*

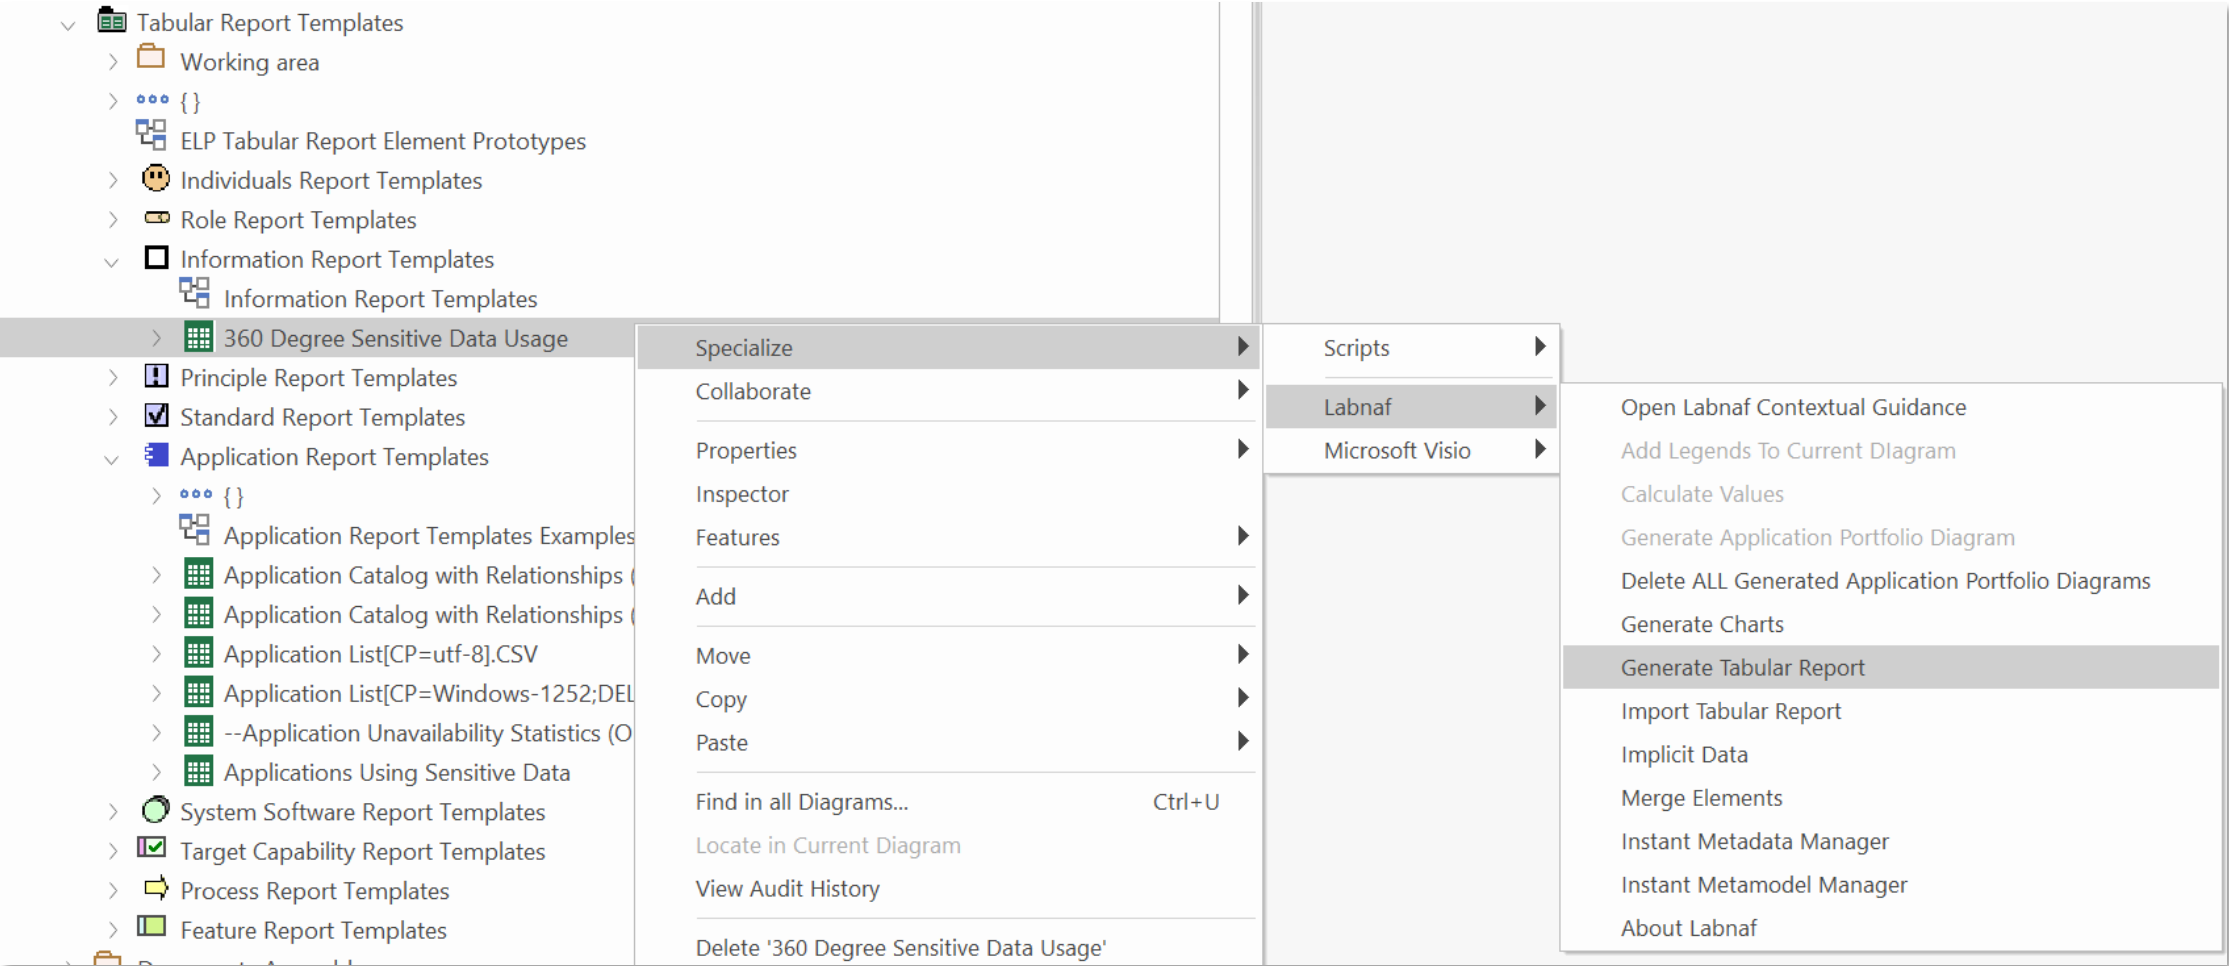

## Generate Report(s)

- Generate reports from the selected templates.
- View the generated reports, or just the last one.
- Open the output folder to see all of generated reports.
- Open the “Log” folder that is located just underneath.
- Locate a selected template in the repository in case you want to make some changes, or if you want to clone and adapt it.

# Using Predefined Report Templates (cont.)

You can also generate a report by selecting a template from the project browser or from a diagram

# Generating Custom Reports

## Define the Custom Report Content

- Select an element type
- Select properties
- Easily reorder properties

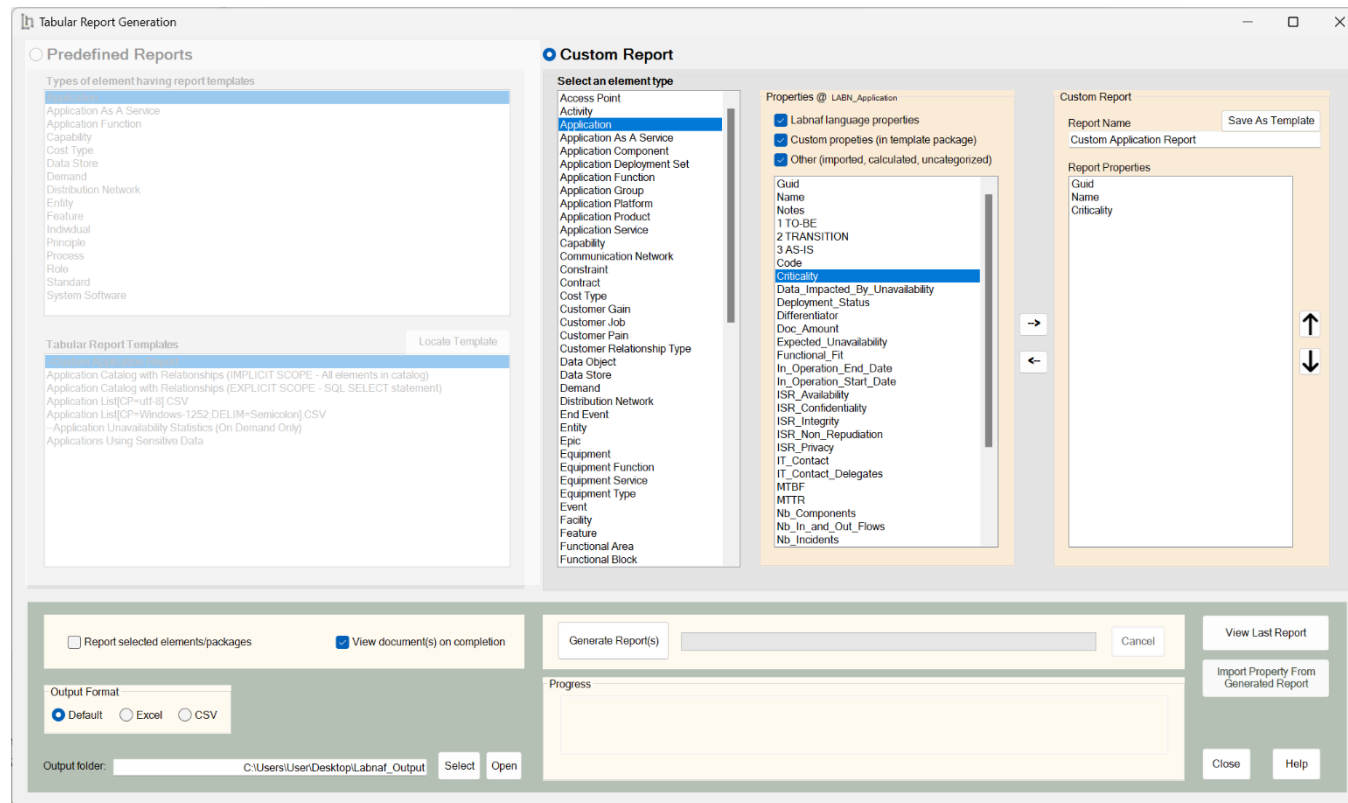

## Select the Output Location and Format

- Select an output folder (typically only once).
- Select an output format (Excel or CSV) i.e. not necessarily using the format defined by the templates.

## Define the Scope

Define a selection of elements (scope) to be generated (the sequence below corresponds to priorities)

- for elements or packages selected in the project browser (if any),
- or for elements or packages selected in the active diagram (if any),
- or for the entire catalog (default).

## Generate, Edit, Import the Custom Report

- Generate and open Excel or CSV, edit values, and import the updates values on the fly if you wish.
- Save the custom report as a template
- Locate and edit the template content and colors, or change the scope of elements to be processed
- Open the output folder to see all the generated reports.
- Open the “Log” folder that is located just underneath.
- Locate a selected template in the repository in case you want to make some changes, or if you want to clone and adapt it.

# Scheduling Tabular Reports Generation

See the  
**Labnaf PowerShell**  
documentation

[https://www.labnaf.one/EndUserMaterial/Labnaf PowerShell/](https://www.labnaf.one/EndUserMaterial/Labnaf_PowerShell/)

# A. Generating Tabular Reports

## B. Creating Tabular Report Templates

1. Scenarios for Starting a New Tabular Report Template
  - a. Custom Report
  - b. Clone & Edit
  - c. Model the Structure
2. Collection of Elements to be Reported (scope)
3. Reported Element Properties
4. Reported Connections
5. Report Format
6. Summary

We will use the creation of an  
**Application Report Template**  
as an example

# Predefined Report Templates: What can be configured?

Report **Format**: Excel or CSV (including character set and delimiters)

Grouping

Group Coloring

Optional column Rename

Connection Group Name

Automatic connection **consolidation** into parent element relationships

Group Name

Element Properties and/or Tagged Values (any sequence)

Optional automatic cell coloring following value

Filtering automatically set

Specific connection type in specific direction to connected element type(s)

Scope: Rule of any complexity for selecting the collection of elements to be reported (e.g. applications)

Scope(s): Where to find the hierarchy(ies) of connected elements. Types can be same or different at each level in the hierarchy

Type of Element to be Reported

Connections Specification

# A. Generating Tabular Reports

## B. Creating Tabular Report Templates

1. Scenarios for Starting a New Tabular Report Template
  - a. Custom Report
  - b. Clone & Edit
  - c. Model the Structure
2. Collection of Elements to be Reported (scope)
3. Reported Element Properties
4. Reported Connections
5. Report Format
6. Summary

# 3 alternative scenarios for Starting a New Tabular Report Template

**Custom  
Report**

Save a custom report as a template

**Clone &  
Edit**

Clone and adapt an existing template

**Model the  
Structure**

Model the tabular report structure

Then complete/adapt the report template...

- Select the collection of elements to be reported (default = entire catalog)
- Define the properties to be reported
- Define the connections/relationships to be reported

# A. Generating Tabular Reports

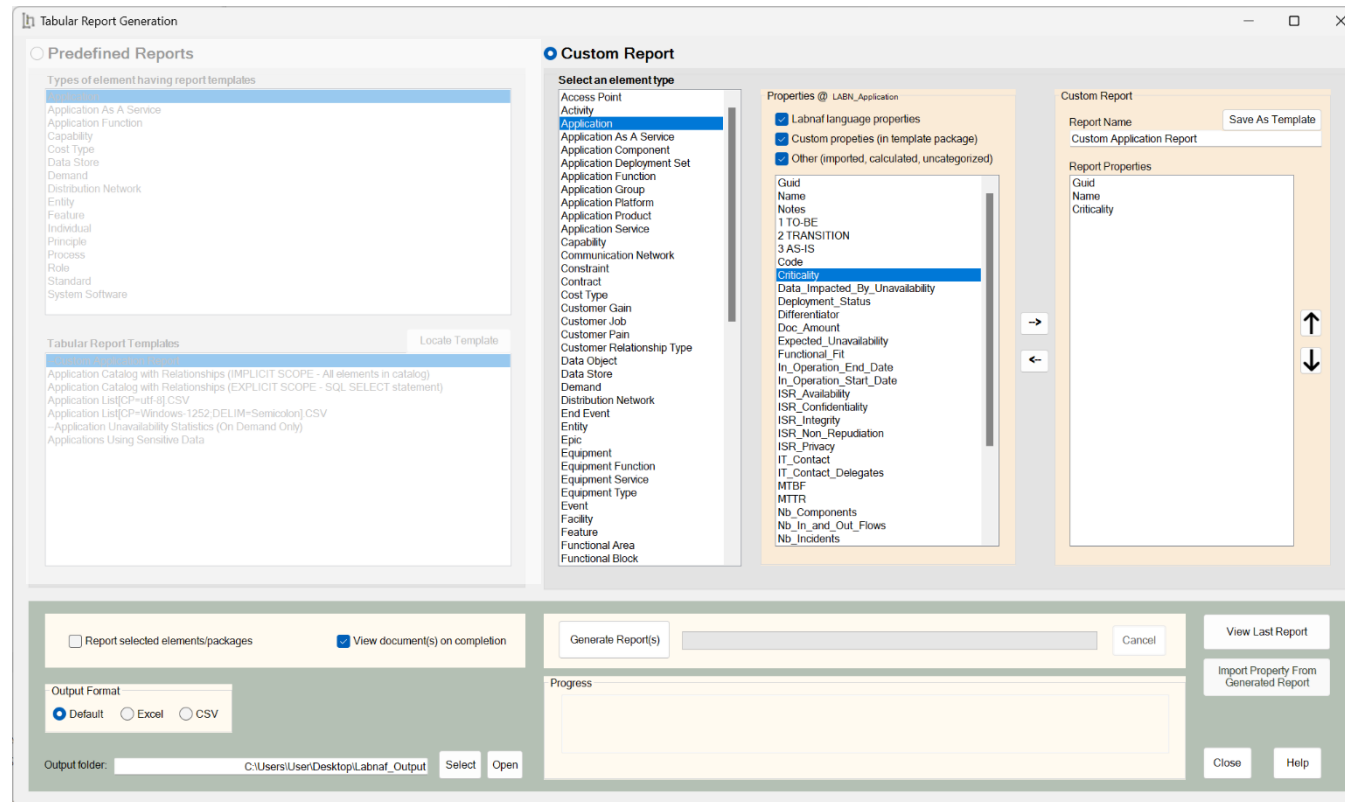

## B. Creating Tabular Report Templates

1. Scenarios for Starting a New Tabular Report Template
  - a. Custom Report
  - b. Clone & Edit
  - c. Model the Structure
2. Collection of Elements to be Reported (scope)
3. Reported Element Properties
4. Reported Connections
5. Report Format
6. Summary

# Creating a Template using the « Custom Reports » option

1. Create a custom report as described earlier in « **Generating Custom Reports** » in the present document.
2. Name the report and click « Save as Template »
3. Locate and edit the template content and colors, or change the scope of elements to be processed as described further in the present document

# A. Generating Tabular Reports

## B. Creating Tabular Report Templates

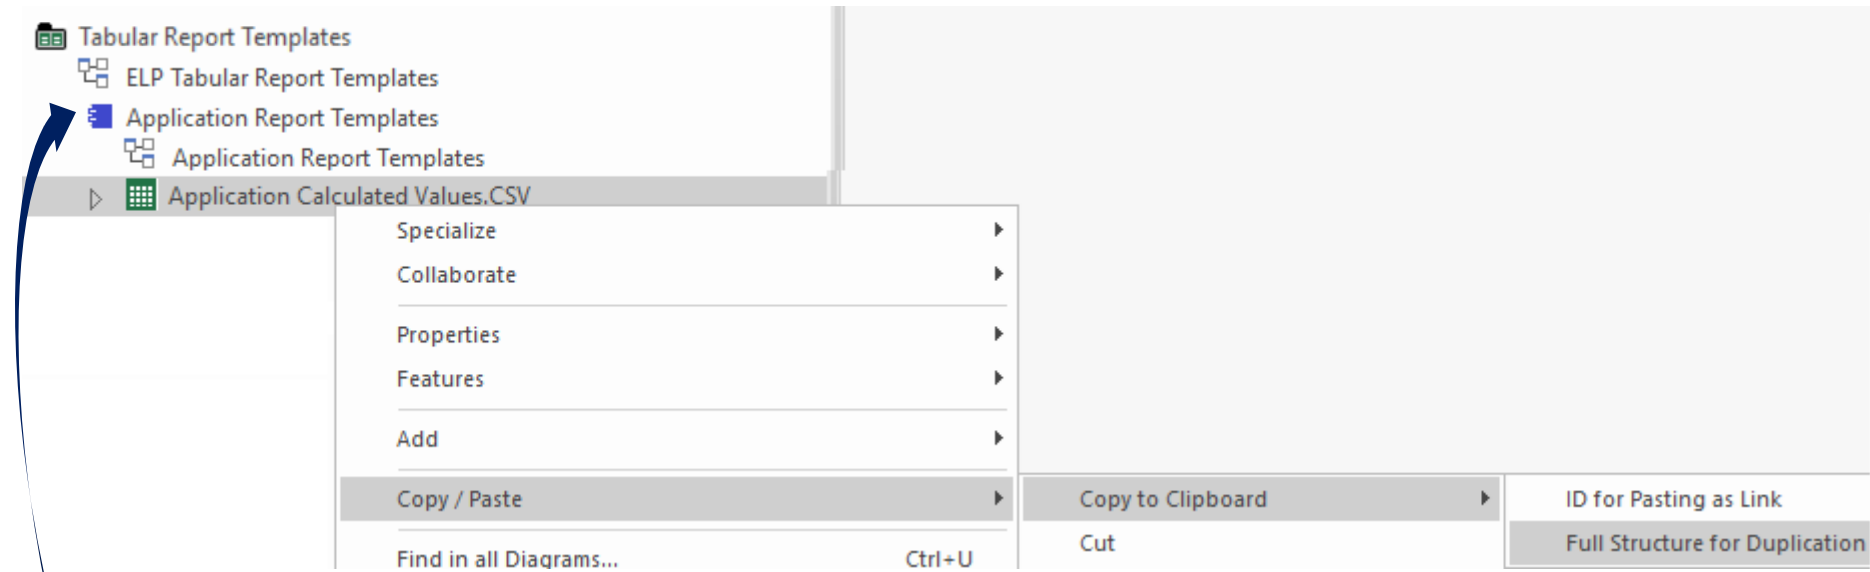

1. Scenarios for Starting a New Tabular Report Template
  - a. Custom Report
  - b. Clone & Edit
  - c. Model the Structure
2. Collection of Elements to be Reported (scope)
3. Reported Element Properties
4. Reported Connections
5. Report Format
6. Summary

# Cloning and adapting an existing template

- Copy an existing application report template

- Paste into the Tabular Report Templates Folder (must be a folder/package)
- Rename the new Tabular Report Template
- Move it into the appropriate element prototype
- Add/remove the content you need.

# A. Generating Tabular Reports

## B. Creating Tabular Report Templates

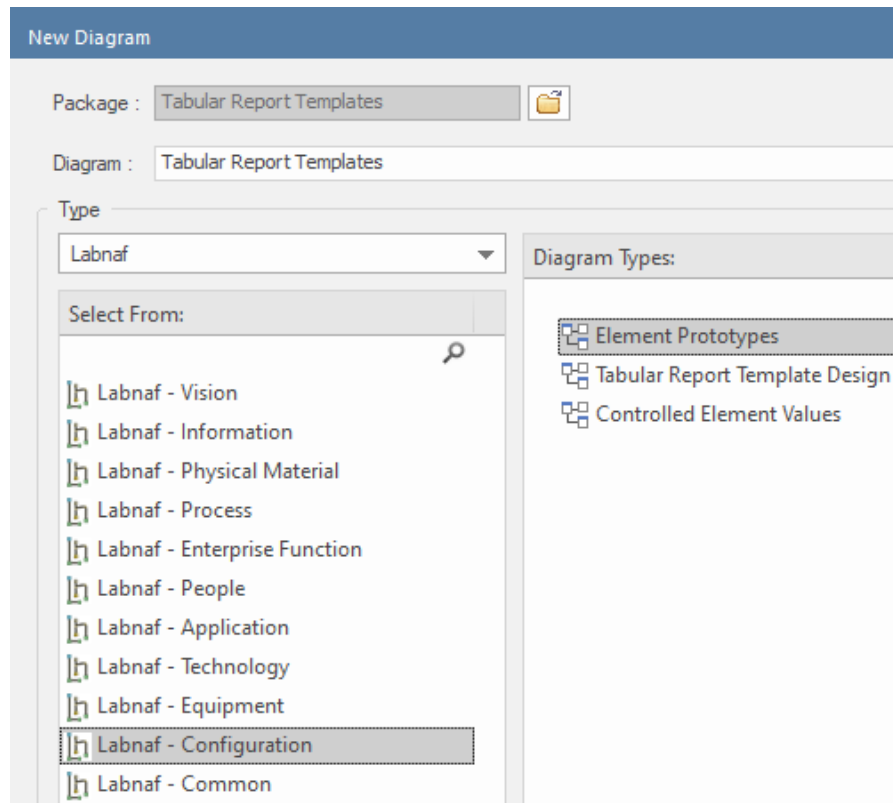

1. Scenarios for Starting a New Tabular Report Template
  - a. Custom Report
  - b. Clone & Edit
  - c. Model the Structure
2. Collection of Elements to be Reported (scope)
3. Reported Element Properties
4. Reported Connections
5. Report Format
6. Summary

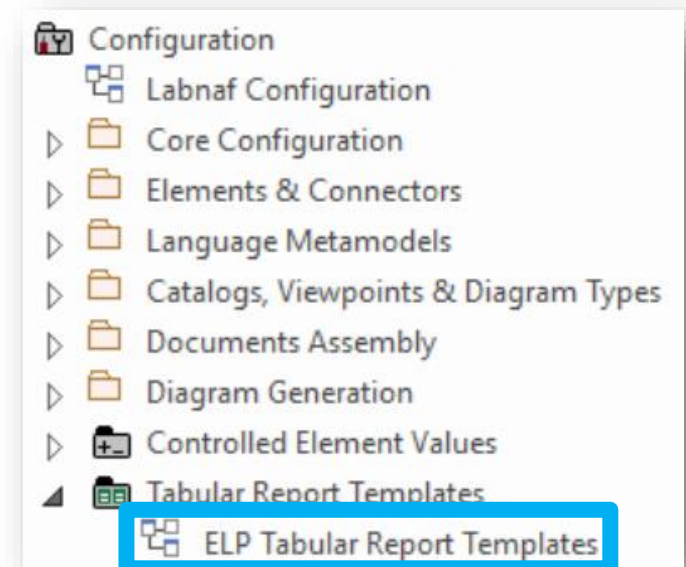

# Define the type of element to be reported...

- If it does not exist yet, create a diagram of type “Element Prototypes”
- Name it, for example, “ELP Tabular Report Templates”

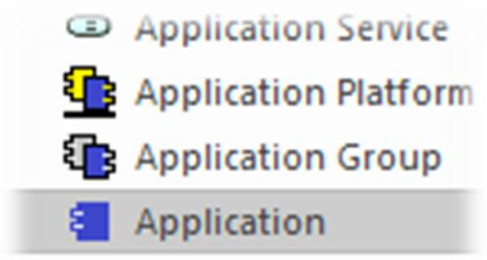

:

# ... using an element prototype

- Select an element in the toolbox  
*You need only one element prototype of each type. But you can have more, for example, to further classify your report templates.*
- Name the element prototype for example “Application Report Templates”

Type of element to be reported

This is an **element prototype** that will group all the application report templates (Excel and CSV).  
By default, the Labnaf PowerShell periodically generates all reports for all element prototypes contained in the “Tabular Report Templates” folder. But you can be selective as well.

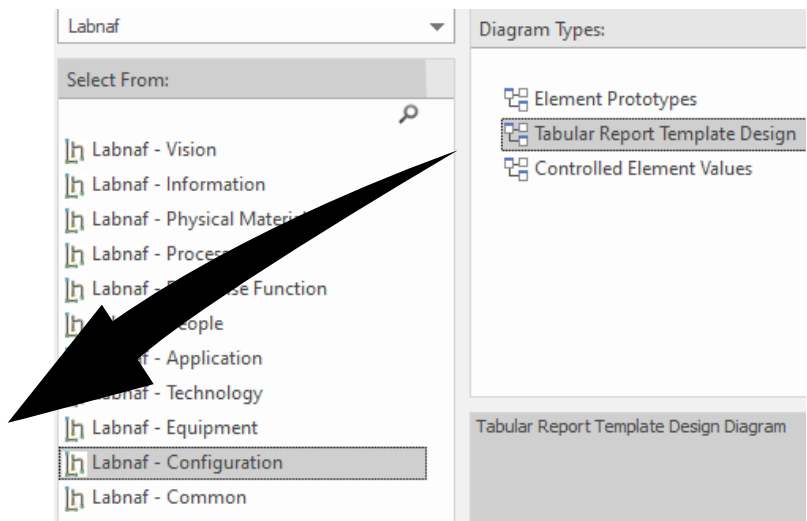

# Add a diagram for creating your Application Report Templates

Right click on the element prototype and select **“Add Diagram”**

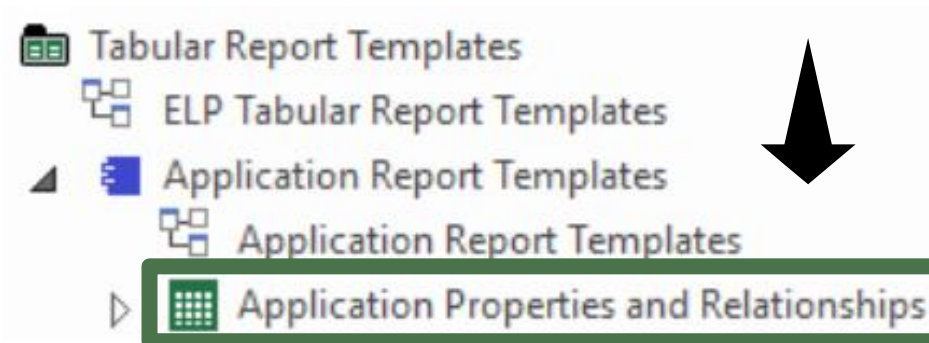

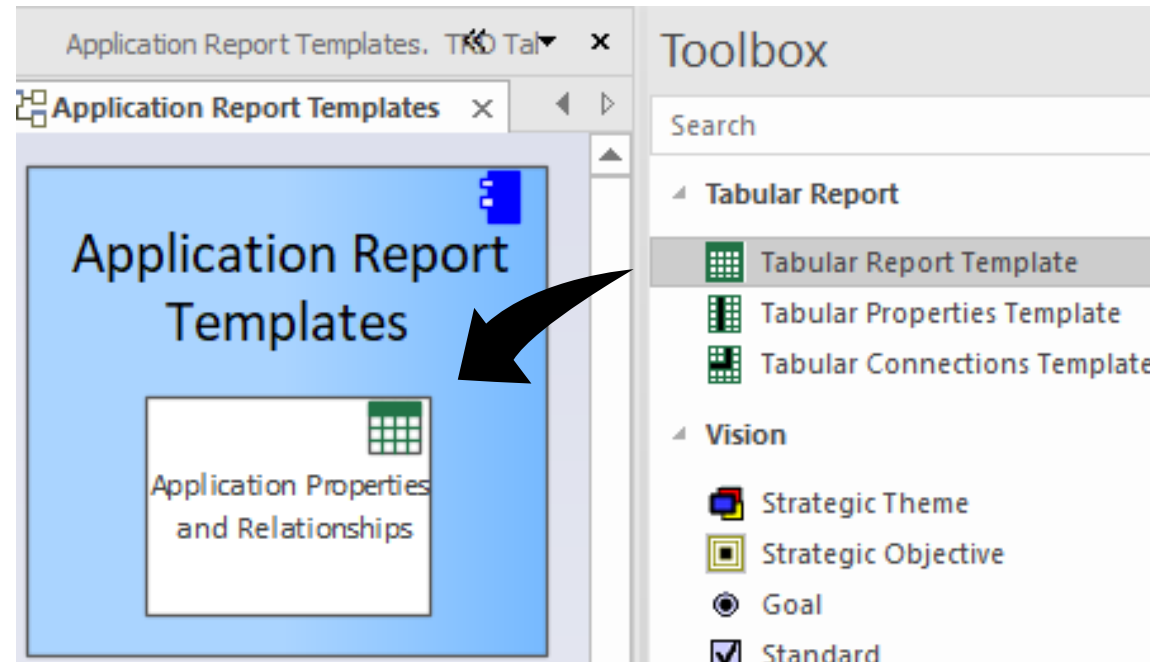

Under **“Labnaf Configuration”**, select **“Tabular Report Template Design”**

# Add a report template from the toolbox

... and name it, for example, "Application Properties and Relationships"

# Complete/Adapt the New Tabular Report Template...

# A. Generating Tabular Reports

## B. Creating Tabular Report Templates

1. Scenarios for Starting a New Tabular Report Template
  - a. Custom Report
  - b. Clone & Edit
  - c. Model the Structure
2. Collection of Elements to be Reported (scope)
3. Reported Element Properties
4. Reported Connections
5. Report Format
6. Summary

# Defining a selection of elements (scope) to be reported

## Options that can be defined in the template

1. Elements and packages present in a “scope” diagram that belongs to the template
2. Elements selected by some SQL select defined in the template
3. All elements in the catalog (default)

*If multiple scopes have been defined, then the above sequence corresponds to priorities*

## Additional option when the report is generated from the user interface

- Report only elements or packages selected in the project browser or in the active diagram

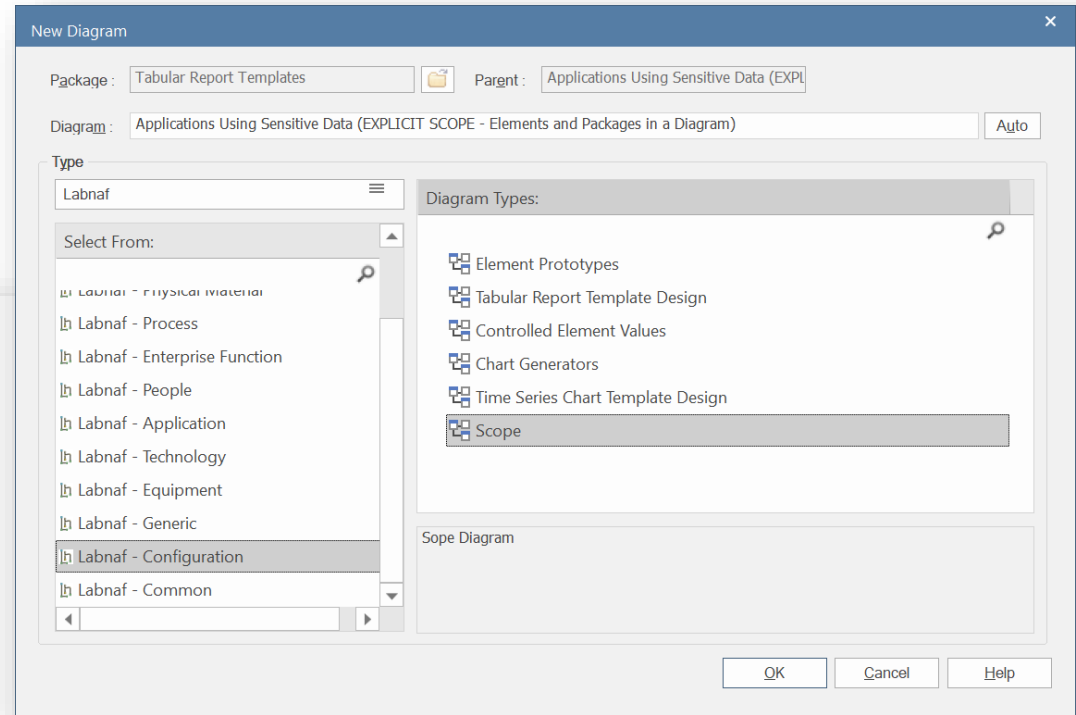

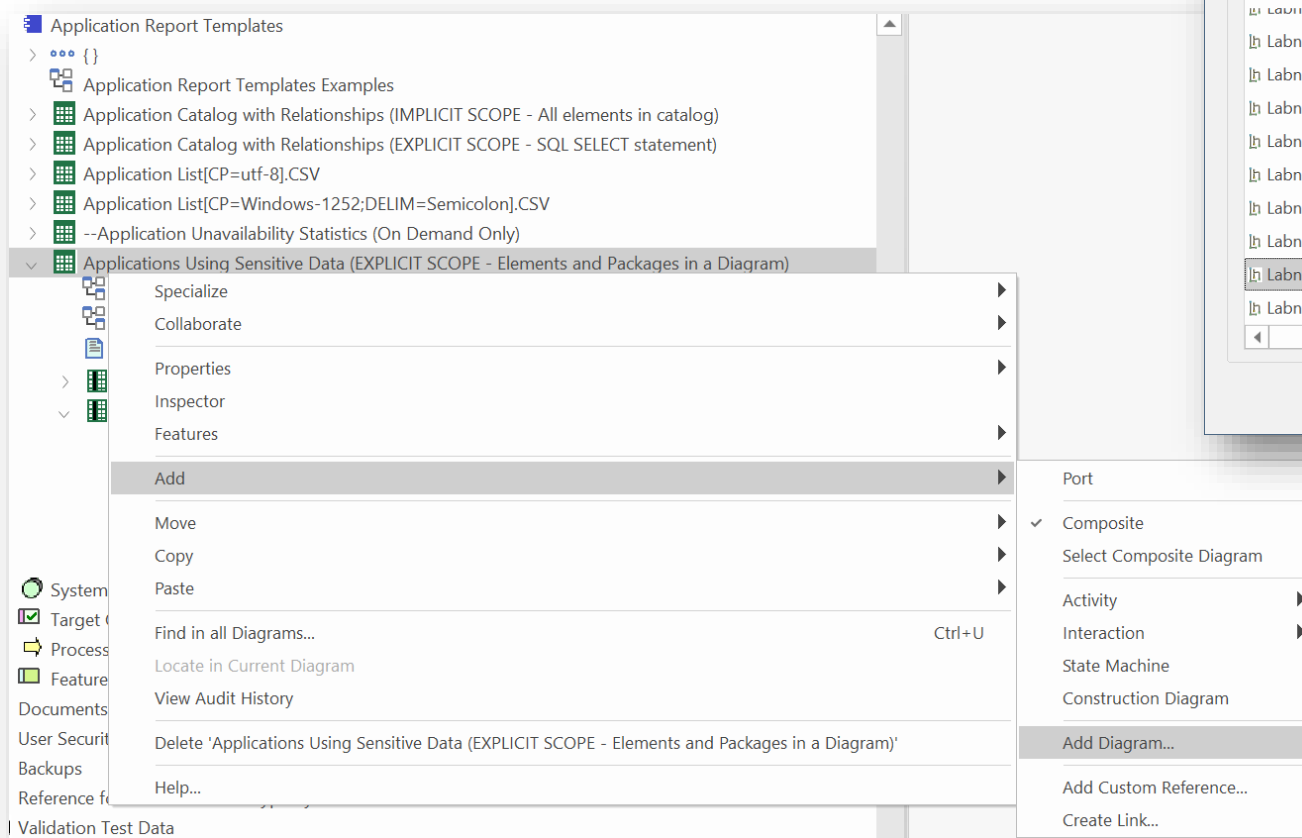

*When selected, this option overrides all the other ones.*

# 1. Scope Diagram

## Creating a “scope” diagram defining the collection of element to be reported

- Select a tabular report template and add a « Scope » diagram

# 1. Scope Diagram

# Populate the Scope diagram

Add the elements and packages to be reported to the scope diagram  
 => the collected elements are

- Elements and packages of elements (including sub-elements) in the scope diagram
- that have the same stereotype as the parent element prototype

Stereotype = 'LABN\_Application'

Application Report Templates

- Application Report Templates Examples
- Application Catalog with Relationships (IMPLICIT SCOPE - All elements in catalog)
- Application Catalog with Relationships (EXPLICIT SCOPE - SQL SELECT statement)
- Application List[CP=utf-8].CSV
- Application List[CP=Windows-1252;DELIM=Semicolon].CSV
- Application Unavailability Statistics (On Demand Only)
- Applications Using Sensitive Data (EXPLICIT SCOPE - Elements and Packages in a Diagram)
  - TRD Application Carrying Sensitive Data
  - SCP Applications Using Sensitive Data (EXPLICIT SCOPE - Elements and Packages in a Diagram)
  - Sample Report - Applications Using Sensitive Data.xlsx

Elements selected by the scope diagram in the generated report

Sub-elements in package

### Custom SQL for selecting the collection of elements to be reported.

By default, all elements with the same stereotype as the element prototype are selected.

Application Report Templates

Application Report Templates

Application Properties and Relationships

The "Notes" property of the Tabular Report Template can contain some SQL SELECT statement. That SQL statements selects the elements that need to be included in the report.

Notes

B I U A x<sup>2</sup> x<sub>2</sub>

```
/* Selection in a 2 levels hierarchy of packages using a variable to be defined as an attribute in the "(((ModelingLanguageConfiguration)))" element */
```

```
SELECT * FROM t_object o
```

```
WHERE stereotype='LABN_Application'
```

```
AND o.Package_ID IN
```

```
(SELECT package1.package_ID FROM t_package package1
```

```
LEFT JOIN t_package package2 ON package2.package_id = package1.parent_id
```

```
WHERE package2.ea_guid = '#MyParentApplicationPackageGUID#')
```

```
ORDER BY Name
```

*With professional database engines, that SELECT statement can reach a level of sophistication that goes way beyond users' requirements.*

*File-based databases, on the other hand, have some limitations, but it is still usually sufficient to implement most use cases. File-based databases are anyway not designed for running on professional database servers.*

# Sample SQL Statements

```
/* Selection in a 2 levels hierarchy of packages */
SELECT * FROM t_object o
WHERE stereotype='LABN_Application'
AND o.Package_ID IN
(SELECT package1.package_ID FROM t_package package1
LEFT JOIN t_package package2 ON package2.package_id = package1.parent_id
WHERE package2.ea_guid = '#uMyVariableContainingAPackageGUID#')
ORDER BY Name

/* selection in a set of packages
SELECT * FROM t_object WHERE stereotype ='LABN_Application' AND package_ID=550
UNION
SELECT * FROM t_object WHERE stereotype ='LABN_Application' AND package_ID=1126
*/

/* Ordered selection in a set of packages (Access only)
SELECT * FROM (
SELECT * FROM t_object WHERE stereotype ='LABN_Application' AND package_ID=550
UNION
SELECT * FROM t_object WHERE stereotype ='LABN_Application' AND package_ID=1126
)
ORDER BY NAME
*/
```

Statement can include comments

```
/* my comment */
```

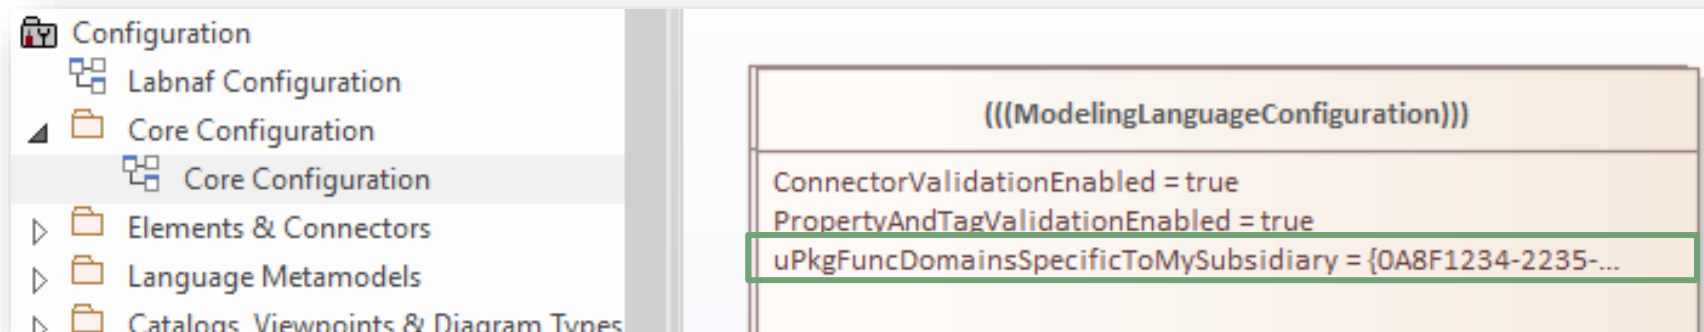

# These SQL statements can include variables

Variables defined in the core configuration can be used in SQL statements. You can add your own variables.

User-define variable must start with the letter 'u'

**Example: A user-defined variable containing the GUID of a package:**

**Usage of the user-defined variable in a SQL statement:**

```
select * from t_object o inner
join t_package p on o.package_id = p.package_id
where o.ParentID = 0 and o.stereotype like 'LABN_%'
and p.ea_guid = '#uPkgFuncDomainsSpecificToMySubsidiary#'
ORDER BY o.Name
```

# Default Scope = All elements in the catalog

By default, all elements with the same stereotype as the element prototype “LABN\_XXX” are selected from the related catalog with stereotype “LNCAT\_XXX”.

```
SELECT * FROM t_object WHERE stereotype = 'LABN_Application'  
AND Package_ID IN  
(SELECT PDATA1 from t_object  
where Object_Type='Package' and Stereotype = 'LNCAT_Application')  
order by Name
```

 Application Report Templates

Application Report Templates

Application Properties and Relationships

A catalog is a set of packages (folders) with a specific stereotype

# A. Generating Tabular Reports

  - a. Custom Report
  - b. Clone & Edit
  - c. Model the Structure
2. Collection of Elements to be Reported (scope)
3. Reported Element Properties
4. Reported Connections
5. Report Format
6. Summary

# Properties

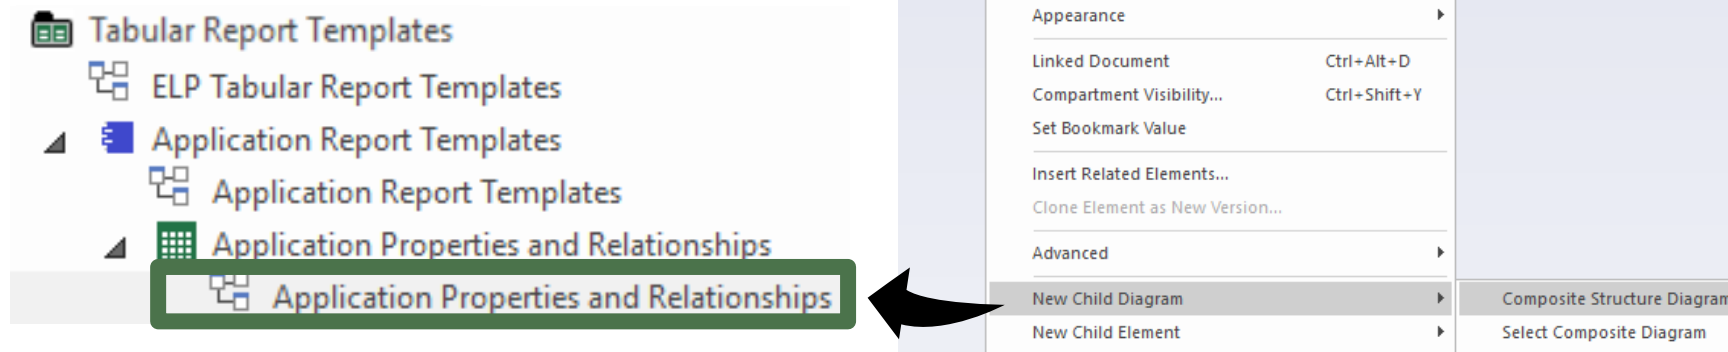

Reporting Element

Properties and Tagged Values

# Add a diagram to enter properties and connections to the report template

Right click on the report template and select **“New Child Diagram > Composite Structure Diagram”**

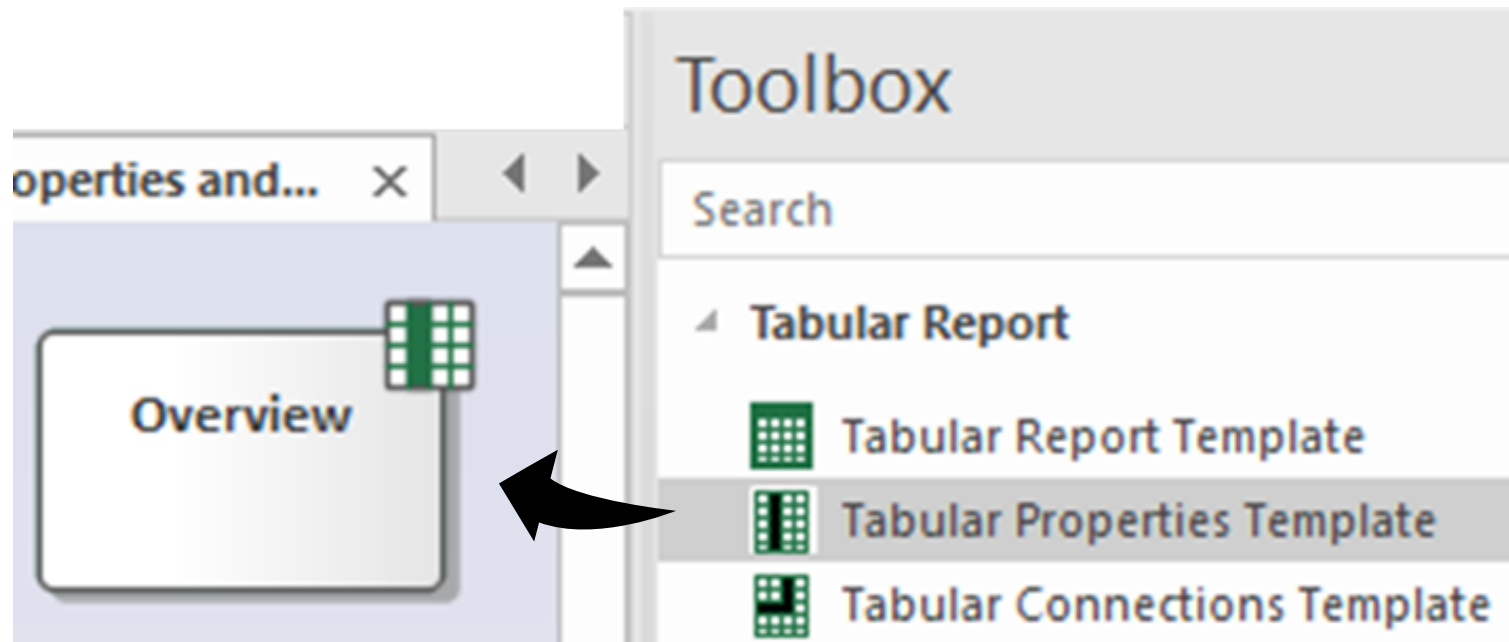

=> A new **Tabular Report Template Design** diagram has been created

Add a “**Tabular Properties Template**” to the new Tabular Report Template Design diagram

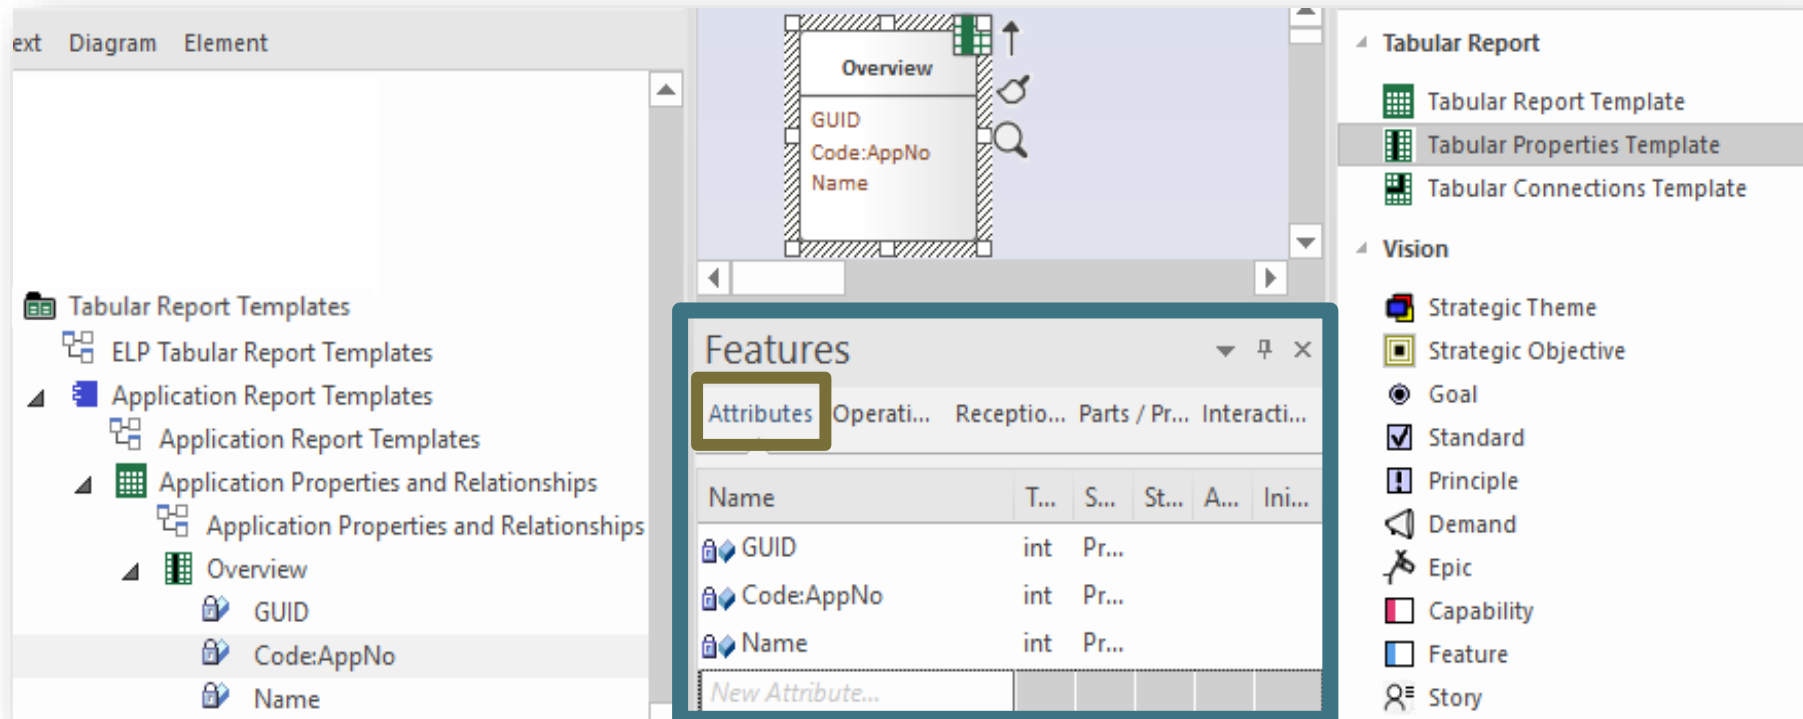

.... and name it for example “**Overview**”

# Add Properties

- Select the Tabular Properties Template in the diagram
- Press F9 to open the “**Features / Attributes**” window
- Enter the desired property and/or tagged value **names**

# Add Properties (cont.)

*In the output tabular reports...*

**Background element colors** will be assigned to property column groups.

If an element appears in more than one diagram the color is selected from the first diagram found.

If such diagram exists under the Tabular Report element then this diagram takes precedence.

**The color cannot be the default element color (otherwise it will be blank).**

Element **Properties** and/or **Tagged Values** (any sequence)

Type CTRL + Up or Down Arrow to change the sequence in the report

**Group Coloring**

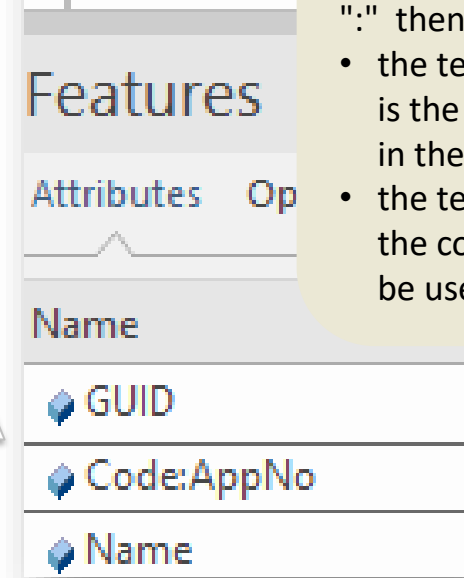

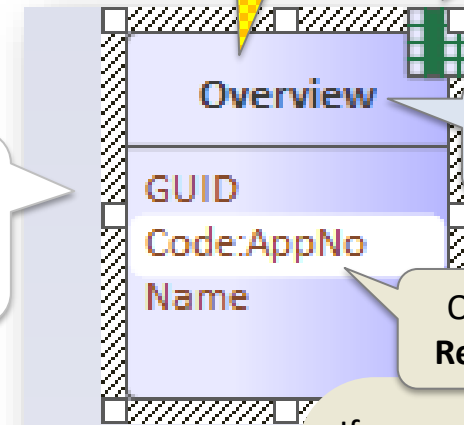

**Grouping** (Tabular Properties Template)

**Group Name**

**Optional Renaming**

If a property name includes the character ":" then

- the text before the ":" is the property name in the repository
- the text after the ":" is the column name to be used in the report

# Adding more groups of properties and/or tagged values

Generate

# Auto-coloring cells following their value

*Numeric and date cells are formatted according to the recognized data type.*

Numeric cells can be automatically colored by setting parameters in the attribute's Initial Value.

Parameters are separated by a semi-column (";").

Recognized parameters are (in any order):

- **Autocolor** => numbers will be colored following a green to red scale where the **lowest** value is best, this being colored in green
- **HighestIsBest** => Coloring is reversed i.e. numbers will be colored following a green to red scale where the **highest** value is best, this being colored in green

Collection of

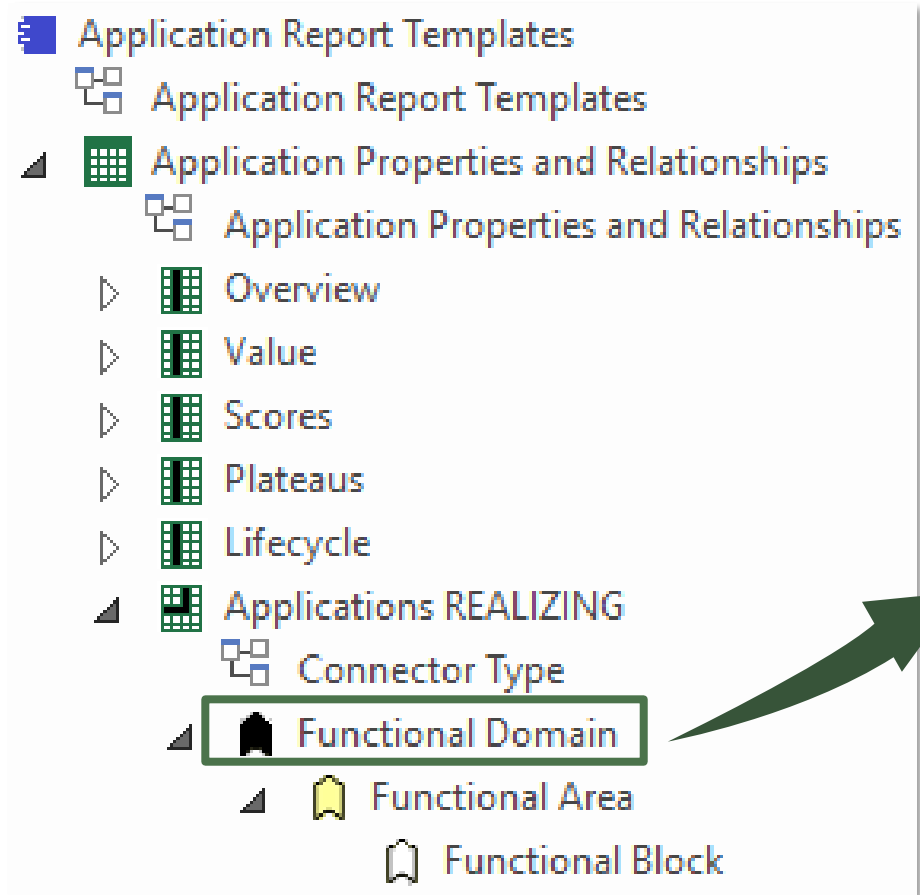

**Connected Elements**

# Selecting connected elements to be reported

## Implicit (default) Selection

By default, Labnaf selects all elements with that same stereotype in the related catalog.

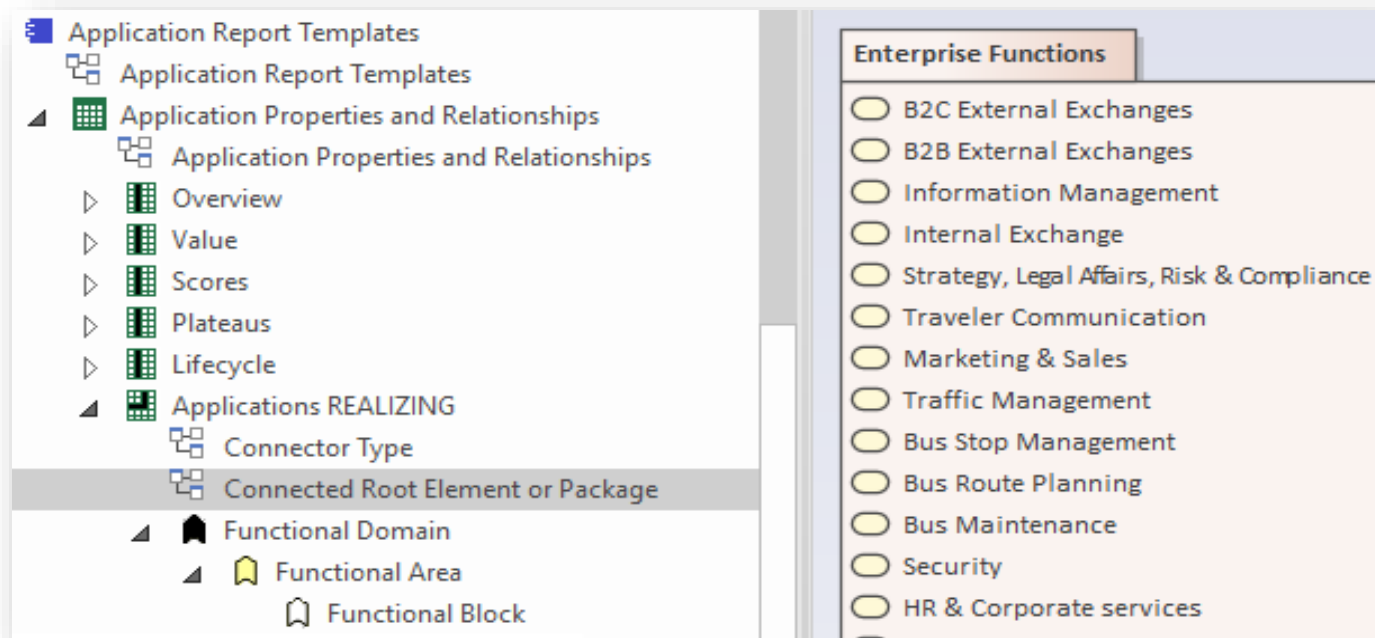

So, in this example, it will collect all elements having a stereotype 'LABN\_FunctionalDomain' in all packages having a stereotype 'LNCAT\_FunctionalDomain'.

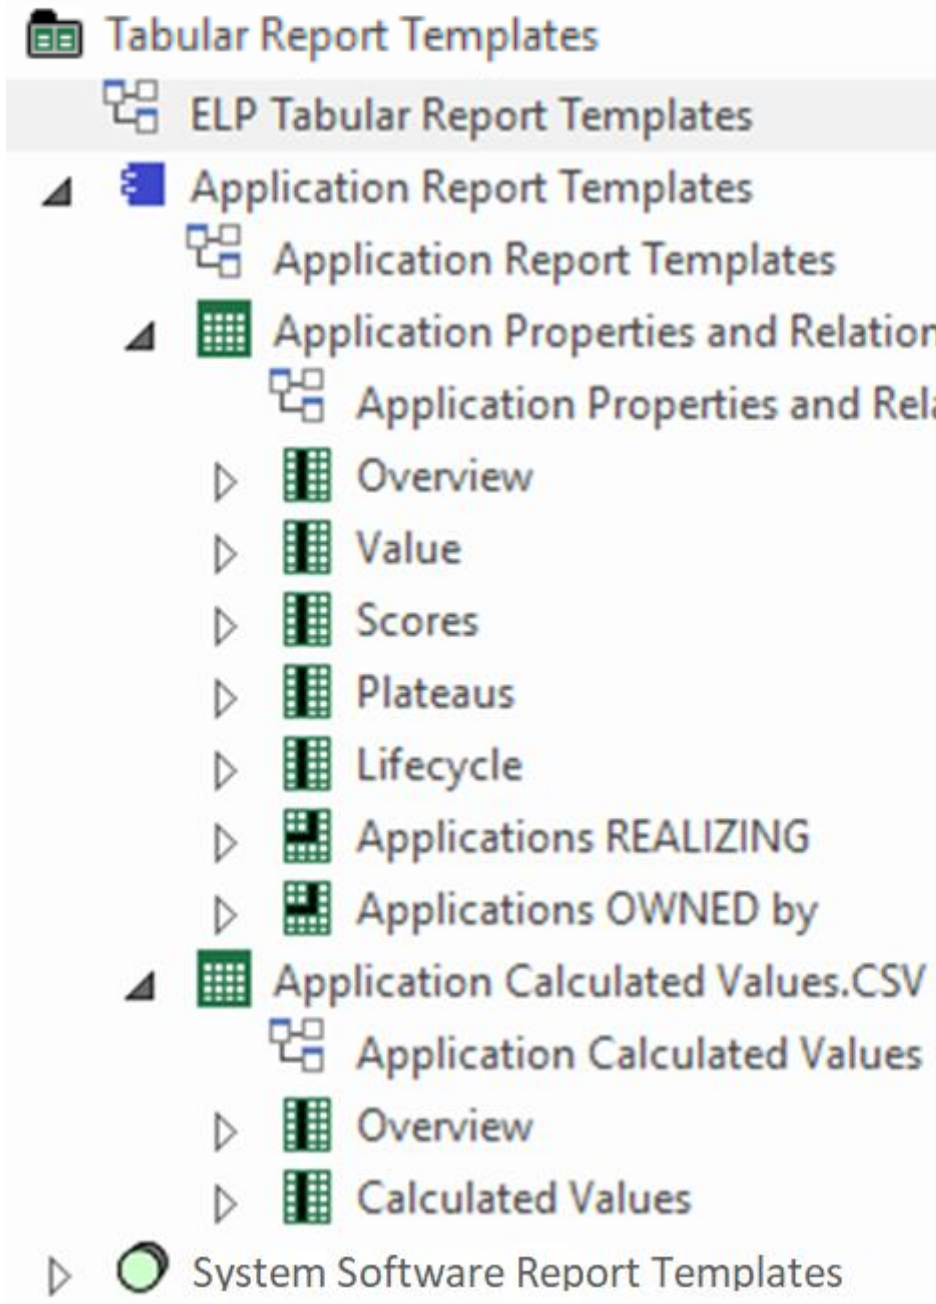

# Selecting connected elements to be reported

## Explicit Selection

- Add a diagram of any type under the new tabular connection template and name it, for example, “Connected Root Element or Package”.
- Add any number of packages and/or (connected) elements to be reported.  
The elements in the packages or the explicit elements should be at the top level in the connected elements hierarchy

- Tabular Report Template
- Tabular Properties Template
- Tabular Connections Template

You can create any number of element prototypes and templates of any kind and in any order

# A. Generating Tabular Reports

## B. Creating Tabular Report Templates

1. Scenarios for Starting a New Tabular Report Template
  - a. Custom Report
  - b. Clone & Edit
  - c. Model the Structure
2. Collection of Elements to be Reported (scope)
3. Reported Element Properties
4. Reported Connections
5. Report Format
6. Summary

# Defining the Report Format

- The report format is defined in the report template name
- The format is therefore also visible in the generated report name (same name as the template)  
*=> by looking at a report name, you can immediately determine its format*

## Application Report Templates

▷  {}

Application Report Templates Examples

▷  Application Catalog with Relationships (IMPLICIT SCOPE - All elements in catalog)

▷  Application Catalog with Relationships (EXPLICIT SCOPE - SQL SELECT statement)

▷  Application List[CP=utf-8].CSV

▷  Application List[CP=Windows-1252;DELIM=Semicolon].CSV

▷  --Application Unavailability Statistics (On Demand Only)

▷  Applications Using Sensitive Data

Default report **format** is **Excel**.  
To generate a **CSV** report, add a “.CSV”  
extension to the report template name.

**Inbound/outbound CSV character encoding** and  
**column delimiters** can be specified in the tabular  
report name itself.

[For further information, see  
« Inbound/Outbound Content Formatting »  
on the Guidance web site.](#)

# Tabular Report Summary

A tabular report can contain tagged values, properties and connections to any kind of element.

# Tabular Report Summary (cont.)

An element prototype for grouping tabular reports  
So we can see that the embedded tabular report definitions are for elements of that specific type and stereotype.

A folder where we define tabular reports

Tabular report template

Element properties to be reported (and renamed if needed)

Tabular Report

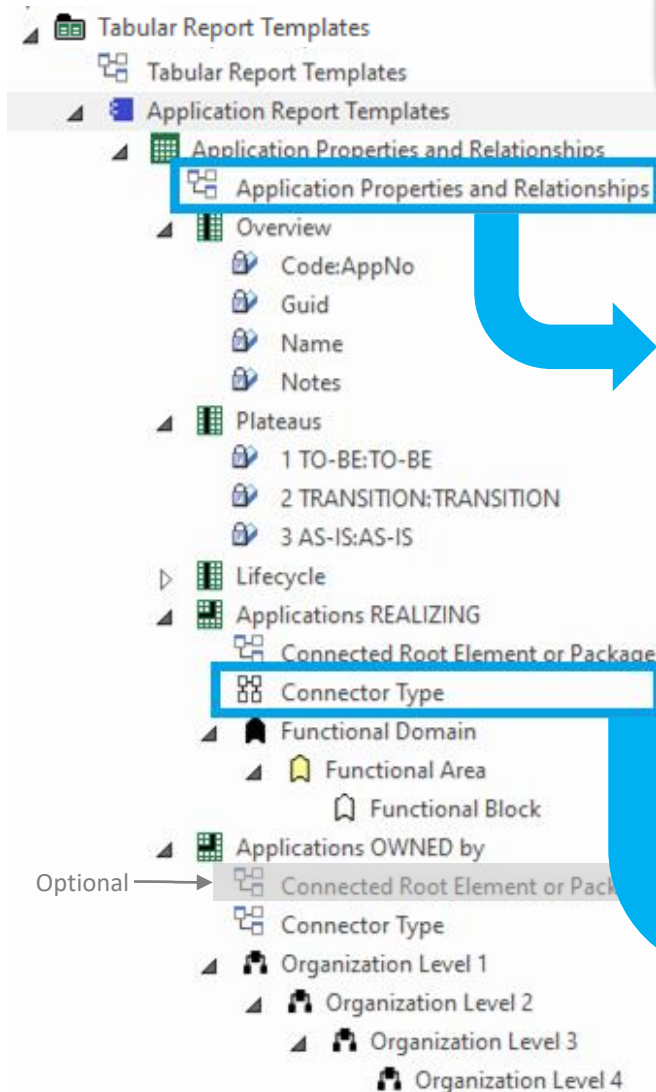

- Tabular Report Template
- Tabular Properties Template
- Tabular Connections Template

Element connections to be reported and consolidated at several levels of detail.  
Connected element types and stereotypes can be different at each level.

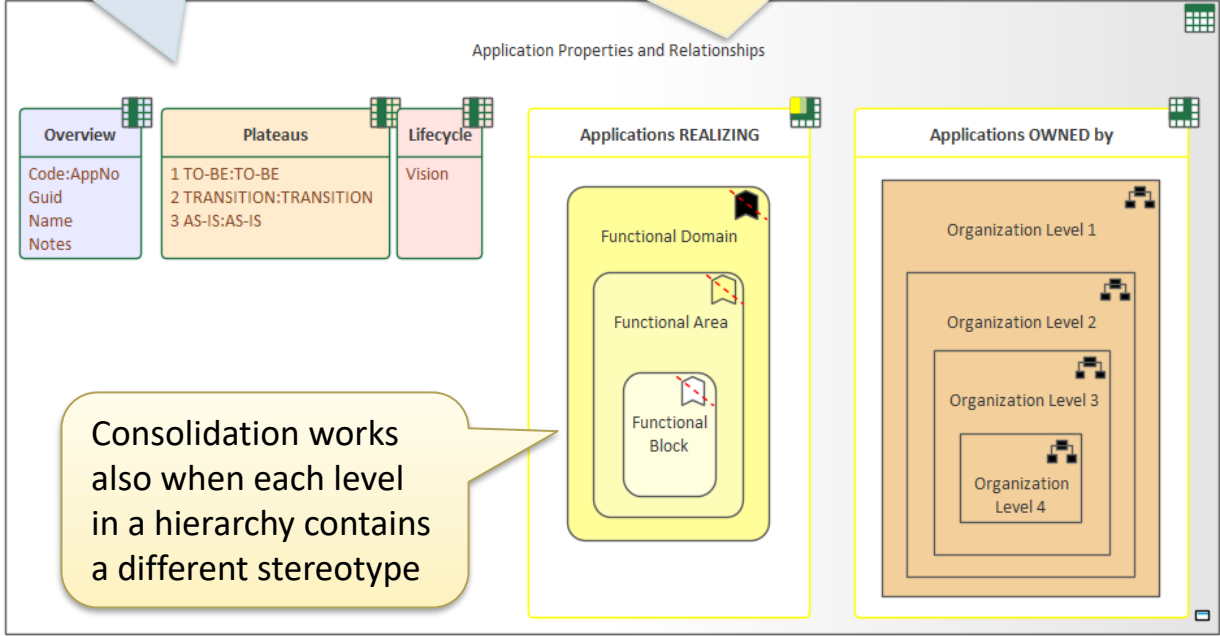

# Tabular Report Summary (cont.)

Model the element properties and/or tagged values with optional renaming and colored groupings

Model the specific connections in specific direction to specific types of elements.  
Model the connection **consolidation** into parent element relationships

Consolidation works also when each level in a hierarchy contains a different stereotype

Optional →

Model the leaf element **connector** to be reported and consolidated
